Super-powered sun protection

Posted Tuesday, April 10, 2007

Avobenzene is an ingredient found in sunscreen that provides UVA and UVB protection. However, it can start to break down and become less effective after just 10 minutes spent in direct sunlight. This is why **LUCA** has put their proprietary Polycrylene, an Avobenzene stabilizer and strengthener, in their moisturizing sunscreen.

Their broad-spectrum SPF15 sunscreen even has a critical wavelength rating right on its label. Critical wavelength is an internationally utilized system for rating UVA protection, and LUCA's rating of 383 is far greater than where many other sunscreens fall on the scale.

This is truly a family sunscreen, perfect for someone who spends a lot of time on the golf course, but also formulated for the sensitive skin of children.
